

Movable Chords 104

This is a great shape to add to your arsenal. It's another shape you can slide up and down the fretboard that will give you access to a useful range of MINOR chords.

So what can we do with the chords we have now learned? We're not far off playing something that is almost a lead solo, WITH accompanying chords. But first we need to learn one more thing.

Scale degrees are notes in a scale or chords within a key. They are usually written as Roman numerals. These describe how far a note is from the root note of the scale or how far the chord is from the root or TONIC note in the key. For example, in the Key of C, the root (Tonic) note is a C. So the chord will be a C MAJOR. So the roman numeral (**I**) is a C Major chord.

The F chord is **IV** because F is the fourth note in the C major scale. The G chord is a **V** because G is the fifth note in the C major scale. Jazz standards are often notated as using roman numeral because it enables musicians to easily transpose a tune to different keys.

The tonality (the combination of tones or notes within the chords) of the chords in a key are:

- I **Major**
- ii *Minor*
- iii *Minor*
- IV **Major**
- V **Major**
- vi *Minor*
- vii *Half-diminished* (don't panic on this: cheat by playing a V – no-one will know)

The Roman numerals also help us to identify the different types of chord available in a major scale. I, IV and V are classed as the **PRIMARY** chords - they are the strongest sounding chords in any key. These are the main chords used in most compositions. The ii, iii, vi, and vii are SECONDARY chord types. They are weaker sounding chords used to connect and support the Primary chords within a composition.

EVERY major scale can be looked at this way.
